

Business Problem Statement: Food Delivery Platform Analysis

A fast-growing online food delivery company wants to better understand customer ordering behavior to improve delivery efficiency, customer satisfaction, and repeat orders. The management team has observed variations in order values across cities, delivery times affecting ratings, discounts influencing repeat purchases, and payment methods impacting customer loyalty. They want to identify key drivers behind customer satisfaction and repeat orders.

Overarching Business Question:

How can the company use food delivery data to optimize delivery performance, increase customer satisfaction, and boost repeat orders?

Deliverables:

- 1 Data Preparation & Modeling (Python): Clean and transform the dataset
- 2 Data Analysis (SQL): Extract insights on customer behavior and delivery performance
- 3 Visualization & Insights (Power BI): Build an interactive dashboard
- 4 Report & Presentation: Summarize findings and recommendations
- 5 GitHub Repository: Include all project files
